

Integrated seat clamp

Seat clamp hidden under the wooden monocoque structure to keep aerodynamic design and looks uncompromised

Lightweight wooden frame 1,85 kg

made out of carefully selected and precisely dried local birch hard wood to minimize our carbon footprint

Monocoque frame design

Monocoque frame design with less than 5mm wall thickness and produced with highly accurate CNC machining delivers excellent weight to stiffness (performance) ratio.

UV protection

Carefully chosen 3-layer transparent coating protects our frames against all weather and road conditions

Hollow chain stay

To reduce the weight even further without compromising the performance, chain stays are made hollow. This feature also allows us to route the rear derailleur cable internally.

Shock and vibration absorbing frame

wood in combination with smart design gives the frame ultimate shock and vibration absorbing capabilities

Super strong epoxy adhesive

In-house developed adhesive gives just the right flexibility to the bonds while keeping them super strong throughout the lifetime of the frame

Cables routed inside frame

Cables are routed inside the frame to make them invisible, while allowing easy maintenance

Aero features

aero features are incorporated to maximize the reduction of air drag

28mm tire clearance

Sufficient clearance allows you to select any road tire you may need to broaden the options of your cycling experience
